# Element-specific 2D Electronic Spectroscopy

## Motivation

To design a spectroscopic tool, which

- ▶ is based on (or simplifies) conventional 2DES experiments.
- ▶ resolves less convoluted spectra than 2DES.
- ▶ focuses on coherence dynamics in molecular aggregates.

# Element-specific 2D Electronic Spectroscopy

## Proposed Experimental Setup

# Verification of ES2DES Design

## Model and Computational Method

Utilize a time-nonlocal quantum master equation (TNLQME) approach, developed by Meier and Tannor.

$$\frac{d\rho}{dt} = -i[H_{\text{mat}} + V, \rho] - \int_0^t \kappa(\tau) \rho(t - \tau) d\tau$$

Meier, C., Tannor, D. J., 1999. J. Chem. Phys., 111, 3365.

# Verification of ES2DES Design

## Post-detectional Signal Processing

Model the non-beating components with  $f(t_1)$ , where

$$\begin{cases} f(t_1) = Ae^{-\lambda t_1} + Be^{-t_1^2/2\sigma^2} + C \\ f(t_1 = t_{1,N}) = 0 \end{cases}.$$

Joo, T. et al., 1996. J. Chem. Phys., 104, 60896108.

For each  $t_2$ , subtract a  $f(t_1)$  fit from the dataset. This gives descent results on dimer and trimer systems.

As  $J$  gets larger,

- ▶ each exciton gets more delocalized over sites.
- ▶ fluctuations of two excitons become correlated.
- ▶ ratio of  $\omega_{\beta\alpha}$  fluctuation to  $\omega_{\alpha}$  fluctuation decreases.
- ▶ peaks get more vertically elongated.
- ▶ magnitude of the captured slope gets smaller.

# Concluding Remarks

- ▶ The design of ES2DES have been verified with time-nonlocal quantum master equation approach on simple Frenkel exciton systems.
- ▶ General spectral characteristics of ES2DES were observed from analytical ES2DES responses under short-time approximation.
- ▶ Information of molecular aggregates provided by ES2DES experiments includes
  - ▶ maps of exciton energy levels involved in coherence.
  - ▶ fluctuation amplitudes and correlations of excitons.
